

Directions for use:

Foundation

For New Pools

Follow builder's instructions for pool start up

Plaster Pools

Allow surfaces to cure according to builder instructions before adding product (National Plaster Council recommends minimum 30 days)

Salt Pools

Follow manufacturer's guidelines for beginning operation of chlorine generator

Before Adding Product:

Always start with a clean pool and active pool filtration. Add Natural Chemistry's METALfree (contains no phosphates) per label instructions to pools containing water with measurable metal content.

1. Adjust water balance to dealer recommended levels (Alkalinity, pH, calcium hardness)
2. Add 5lbs Foundation for each 6000 gallons (22,700L) OR 16.5lbs Foundation for each 18,000 gallons (68,100L) to 22,000 gallons (83,200L) of pool water. With circulation pump running, slowly add to the pool skimmer. If desired, Foundation can be added directly to pool water (some short term cloudiness may occur)
3. Brush any residual material until dissolved. Wait 20 minutes after adding product before swimming

Note: In some pools, application of Foundation may cause temporary cloudiness. Test pH and chlorine levels weekly and adjust as necessary. Test phosphate levels monthly
